EXPERIENCE

Senior Software Engineer (Data Platform), Mapbox — September 2026 to Present

Senior Data Engineer, Meta (WhatsApp) — March 2021 to August 2026

Impersonation Integrity Detection & Prevention

- Designed and built a protected username registry to safeguard high-value accounts during the global rollout of public usernames, preventing impersonation of public figures and brands at launch scale.
- Developed a key scraping detection metric to quantify and track malicious username harvesting activity across the platform.
- Created the team's KPI dashboard calculating impersonation contact rates and statistically debiased precision and recall measurements, enabling data-driven enforcement decisions and goaling.

Business Paid Messaging Analytics

- Improved data collection reliability and coverage for business-to-consumer paid messaging interactions.
- Designed the end-to-end business interaction funnel, providing visibility into user engagement from message delivery through to conversion, informing product and monetisation strategy.
- Partnered with legal counsel to define compliant data collection strategies for impression, format, and revenue metrics, balancing analytical needs with regulatory and privacy requirements.

User Research Surveys & Measurement

- Integrated WhatsApp with the company's centralised survey infrastructure, establishing a scalable foundation for user research.
- Launched 5 major sentiment tracking surveys, enabling continuous measurement of user sentiment and trust.
- Provided ongoing data support and education to user experience research teams, democratising access to survey insights.
- Built automated data processing and statistical weighting pipelines, reducing turnaround time from raw responses to actionable insights.
- Owned the critical "Counting Accounts and People" survey — WhatsApp's methodological backbone of the Monthly Active People metric reported in quarterly earnings calls.

End-to-End Encrypted Messaging Integration

- Led alignment on the data collection strategy for integrating end-to-end encrypted messaging across Facebook Messenger and Instagram Direct, preserving WhatsApp's privacy-first principles.
- Landed the principal performance, reliability, and efficiency metrics for encrypted messages on the newly integrated platforms.

Data Infrastructure Modernization

Pipeline Migration

- Led strategy and implementation for migrating data collection from a legacy bespoke infrastructure to the company's modern unified platform, delivering:
 - Hourly scheduling options by default
 - Reduced data landing times by ~1 day
 - Improved data enrichment capabilities
 - Stronger privacy controls and compliance posture

Access Control Overhaul

- Contributed to a comprehensive redesign of dataset access control policies, focusing on efficiency, regulatory compliance, and least-privilege principles.

Warehouse Capacity Optimisation

- Led efforts to streamline data warehouse usage, reclaiming ~6 petabytes of storage and reducing compute usage by ~30% in some of our largest pipelines.

AI Tooling

- Top 30% AI Adopter at Meta based on rolling average of Active Days and Daily Sessions across many tools, both industry-standard (Claude Code, Codex) and proprietary (DevMate, Analytics Agent).

Senior Software Engineer (Data Platform), Vacasa — April 2019 to February 2021

- Stood up core data infrastructure — Airflow, Presto/Trino, DBT, Redshift, and Looker — supporting dozens of stakeholders across the organization.
- Reduced annual data infrastructure costs by hundreds of thousands of dollars through usage analysis and negotiated long-term AWS agreements.
